ScamCatch

A voice conversation when someone may be facing a scam

A product of Mirae Opus LLC

Jonathan Kim, Founder

Development prototype. scamcatch.io

The cost of a missed pause

$2.4B

Fraud losses reported by US adults age 60+ in 2024

About four times the reported amount in 2020

Our hypothesis

A calm voice conversation could help someone pause and verify a request before sending money.

We need to measure whether that changes outcomes.

Source: FTC, Protecting Older Consumers, 2024–2025. Reported losses only.

The proposed intervention

01 **A bank flags a risky payment attempt**

Planned integration. The signal must arrive before the payment completes.

02 **ScamCatch starts a voice conversation**

It asks the person to pause and explain the situation.

03 **The person verifies the request independently**

Proposed next steps include a known bank number or a chosen trusted contact.

Today: Android development prototype with a voice warning after a flagged screen check.

Target users and buyers

01 **Users: older adults**

Voice support during a suspicious payment request.

02 **Potential buyers: families and institutions**

Older adults and their adult children. Banks, credit unions and senior living homes.

03 **Initial use case: an urgent transfer**

Start with an unusual payment to a new recipient.

The first buyer, distribution channel and budget still need validation.

Market context and sizing

61.2M

US adults age 65+ in 2024

18% of the US population

Revenue sizing

1. Select a reachable institution segment.

2. Validate covered users and pricing.

3. Calculate an annual revenue opportunity.

Population context only. Revenue market estimate pending.

Source: US Census Bureau, Vintage 2024 Population Estimates, June 26, 2025.

Existing tools and our proposed focus

Product	Current or proposed focus
Carefull	Financial monitoring and alerts. View-only support for trusted contacts.
ZoraSafe	Suspicious-content checks. Risk explanations and next steps.
ScamCatch	Proposed voice conversation after a bank signal. Android voice prototype exists in development.

The pilot must establish whether the conversation improves decisions.

Prototype evidence and traction

Implemented in development

1. Android screen checks with consent.
2. A warning after a flagged check.
3. An AI voice conversation after setup.

Early development

1. 0 users and 0 formal research studies.
2. 0 pilots and 0 contracts.
3. 0 customer commitments.

Bank triggers and alerts to institutions or trusted contacts remain planned.

Proposed revenue model

Institutional licensing

Proposed: institutions pay to offer ScamCatch to customers or residents.

1. Initial buyer and pricing remain pending.
2. Validate a paid pilot and an annual license with a usage allowance.
3. Set prices after voice cost and support requirements are known.

Revenue, funding and runway

Required fact	Status
Revenue, MRR and ARR	$0 total revenue / $0 MRR / $0 ARR
Capital raised to date	$0
Currently raising funds?	No
Remaining runway	Ongoing at current prototype scope*

*Founder estimate. Operating costs and scope can change.

Founder and application goals

Jonathan Kim

Sole founder and software engineer
Mirae Opus LLC, California

No other team members or advisors.

This is Jonathan’s first startup.

Mission: reduce the money people lose to scams.

What we seek

1. Older-adult research participants.

2. Fraud-specialist feedback.

3. A bank or credit union pilot partner.
